WILEY

Dear Mr. Md. Siam Ansary,

We are delighted to inform you that your manuscript 3992539, titled "A Multi-Representation Stacked Ensemble for AI-Generated Text Detection", has been accepted for publication in International Journal of Intelligent Systems.

You can find reviewer comments at the bottom of this email, if applicable.

What happens now?

We will now check that all of your files are complete before passing them to our production team for processing. We will let you know soon if we require any further information.

Once the manuscript has been sent to production, Wiley will email the corresponding author with information about:

- Signing the license
- Paying any applicable article publication charges (APCs)
- Reviewing manuscript proofs

To learn more, read [Wiley's publication guide for authors](#).

If your submission contains supporting information, please read Wiley's [supporting information FAQs](#). Supporting information is not copyedited, checked, or changed from its original format. If you notice an error, please get in touch with us as soon as possible.

Thank you for choosing to publish with International Journal of Intelligent Systems.

MANUSCRIPT DETAILS

Kind regards,
Dr. Richard Murray
International Journal of Intelligent Systems

P.S. – You can help your research get the attention it deserves! [Wiley Editing Services](#) offers [professional video abstract](#) and [infographic creation](#) to help you promote your research. You can also read Wiley's [free Promotion Guide](#) for best-practice recommendations on effectively promoting your work.

Reviewer comments:

“

Reviewer 1 Comments to the Author

The reviewer appreciates the authors' thorough and constructive efforts in the revised manuscript. The authors not only provided clear and point-by-point responses to all reviewer comments in the rebuttal letter, but also implemented substantial revisions in the main text (e.g., adding new experiments, refining method descriptions, and including computational cost analysis). These improvements significantly enhance the rigor, credibility, and overall quality of the paper. The current version has effectively addressed the major concerns raised in the first round of review.

1. Baseline Model Comparison and Ablation Study

The authors have added a new section, "Baseline Model Comparison (VI)", which introduces comprehensive comparisons with both deep contextual models (BERT, RoBERTa) and traditional machine learning approaches (TF-IDF + LR, SVM). In addition, the newly included ablation studies systematically quantify the contributions of Transformer representations, contrastive embeddings, handcrafted features, and LLM-based meta-features. These additions are highly convincing and provide strong evidence for the effectiveness of the proposed multi-representation stacked ensemble framework.

2. Dataset Generalization and Data Leakage Concerns

The authors supplemented the manuscript with cross-dataset generalization experiments. The results show a reasonable performance drop under cross-dataset evaluation (AUC decreases to 0.95–0.96), and the manuscript includes an objective discussion of dataset homogeneity limitations. These additions adequately address concerns regarding generalization and potential data leakage.

3. Reproducibility and LLM Details

The revised manuscript clearly specifies the large language model used for meta-feature extraction (LLaMA-2-7B-Chat). It also provides detailed descriptions of the inference setup, including gradient-free evaluation and fixed decoding parameters (e.g., Temperature = 0, Max tokens = 20) to ensure deterministic outputs. These clarifications are comprehensive and fully meet the requirements for reproducibility.
